

## A Full-Featured, Free Security Suite

"Scam," "identity theft," "data breach" - those are words you see too often in the headlines. Any one that happens to you can ruin your day, week or even decade. The first step to preventing this from happening is installing good security software on your computer.

Comodo's Free Internet Security Suite is a good option. It includes antivirus, anti-spyware, a firewall and other essential features. One of its more powerful abilities is automatic sandboxing. If a file or program is unknown, Comodo runs it in an isolated place so it can't hurt your computer. This security suite even offers zero-day attack protection on viruses, Trojans, worms, and other nasty programs trying to get into your computer. This means that Comodo can protect you from Day One of a virus or malware outbreak.

Comodo also has a great support system. You can get support via live chat, email, through the phone or with the online help guide if you run into trouble.

As an added bonus, Comodo is free for business use as well. And you can also upgrade to a Pro edition that has additional features if you need more security. You can try the upgrade absolutely free!

Cost: Free

## Find Out If Hackers Have Your Info

What do Adobe, OKCupid, Sony and JP Morgan Chase have in common? They've all had data breaches in the last few years that have exposed customer information. Hackers have snagged millions of usernames, email addresses, passwords and even credit card numbers this way.

So, does that mean your information is floating around in hackers' hands somewhere? This site can tell you.

PwnedList is an easy-to-use service with a robust database of information that hackers and malicious programs have released publicly. You can enter your email address and see if you're on any of the lists.

If your email address is out there, you can take steps to make your account passwords stronger. Of course, you should be making them strong anyway.

Want to be notified about future breaches? Just sign up with PwnedList and enter an email address you use for an online account. If your address ends up on a hacker list you'll know right away. You can have PwnedList monitor up to three email addresses.
